

REPORT ON MINI PROJECT

Name: Keerthana Kumaresan
Batch Code: TN_DA_FNB07
Contact No: 9600230895
Mail ID: keetz1125@gmail.com
Project Title: Sales Performance Analysis of a Retail Superstore
Project Domain: Sales & E-Commerce
Submission Date: Dec-10
Mentor Name: Kumaran M

Raw Dataset Link:

<https://drive.google.com/drive/folders/1h30aF9Cm9CYKFnIBjVwhcwmdbBXAV0vK?usp=sharing>

Cleaned Dataset Link:

<https://drive.google.com/drive/folders/1Dv51767DT7tWGxHfeiKQTudz9WkzZufe?usp=sharing>

Purpose of the Project

The purpose of this mini project is to analyse retail sales data from a Superstore and generate meaningful business insights using Excel for data cleaning and Power BI for data visualization.

This project aims to:

- Understand sales performance across different regions, product categories, and customer segments.
- Identify trends, high-performing products, and profitability using interactive dashboards.
- Support business decision-making by transforming raw data into clear, visual insights.
- Showcase skills in data preprocessing, analytical thinking, and Power BI dashboard creation.

Objective of the Project

The main objectives of this project are:

- **To perform data cleaning and preprocessing using Excel**, including removing duplicates, handling missing values, and creating calculated fields.
- **To analyse sales performance** based on categories, regions, customer segments, and product types.
- **To create an interactive Power BI dashboard** using various visualizations like bar charts, pie charts, line charts, cards, and slicers.
- **To derive actionable insights** that help understand trends in sales, profit, quantity sold, and discount patterns.
- **To demonstrate end-to-end data analytics skills**—from dataset selection to report creation and interpretation.

Data Cleaning in dataset

I began the cleaning process by converting the data range into a structured Excel table using Ctrl + T, making the dataset easier to manage and format.

Remove Duplicates

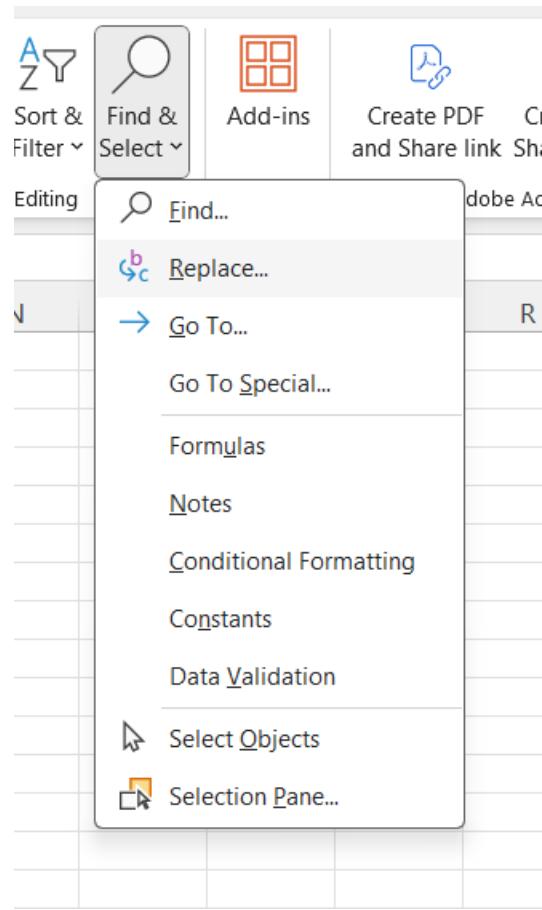

The dataset was cleaned by removing all duplicate entries, ensuring that only unique and valid data points were retained.

The screenshot shows the 'Remove Duplicates' dialog box in Microsoft Excel. The dialog box is titled 'Remove Duplicates' and has a 'Columns' section where checkboxes are present for each column from A to M. The 'My data has headers' checkbox is checked. At the bottom right of the dialog box, there are 'OK' and 'Cancel' buttons.

Used Remove duplicates option in the ribbon and removed all the duplicate values present in the dataset.

Replace Inconsistent Data:

- Ensured all date values were in the same format (DD-MMM-YYYY).
- Standardized text fields such as Category, Region, and Segment to avoid spelling variations.

Fixed irregular numerical entries

- Checked for negative or unrealistic values in Sales, Profit, and Quantity.

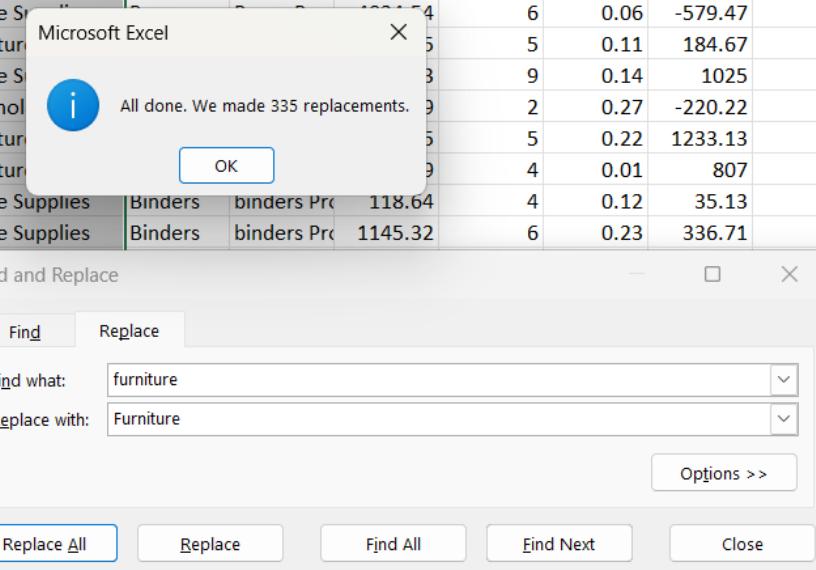

- Converted all numerical columns into proper number format (removed currency symbols/text).

Corrected spelling and naming inconsistencies

Used Find & Replace to correct inconsistent names (e.g., “furniture” vs “Furniture”)

Ensured consistency in capitalization

- Converted inconsistent text formats into a standard form (e.g., Proper Case).
- Removed inconsistent data in category column using find and replace option.

The screenshot shows a Microsoft Excel spreadsheet with data in columns: Region, Category, Sub-Categ, Product Name, Sales, Quantity, Discount, Profit. A 'Find and Replace' dialog box is open over the spreadsheet. The 'Find what:' field contains 'furniture' and the 'Replace with:' field contains 'Furniture'. The 'Replace All' button is highlighted. A confirmation message box is displayed, stating 'All done. We made 335 replacements.' with an 'OK' button.

- Identified missing or blank cells in numerical and categorical columns. Filled the missing value in sub category column by analyzing the category column .
- Replaced missing numerical values using methods like:
 - Average (mean)
 - Median
 - Zero (only if logically meaningful)
- Filled missing categorical fields with:
 - Most frequent value (mode)
 - “Not Available” or “Unknown” tag
- Ensured no empty fields remained before importing into Power BI.
- Validated the filled values to maintain accuracy and avoid bias.
- Documented all changes so the cleaned dataset remains transparent and reproducible.

- Data Bars were applied in Excel to visually compare values within the column.
- They help highlight higher and lower values through bar lengths, making interpretation easier.
- Using Data Bars improved the readability of numerical data and helped identify patterns at a glance.
- This visual enhancement made the dataset more intuitive for analysis.

- A color scale was used to differentiate values using gradient colors based on magnitude.
- It allows quick identification of high, medium, and low values using color intensity.
- Color scales helped highlight important patterns such as highest sales, lowest profits, or discount variations.
- This made the dataset visually organized and easier to interpret before creating Power BI visuals.
- Applying color scales improved data understanding and supported better decision-making.

1. Category Type

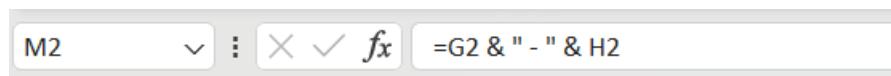

Purpose:

To combine **Category** and **Sub-Category** into a single descriptive field for easier analysis in Pivot Tables and Power BI.

How it was created:

A calculated column was created in Excel by merging the two fields.

Formula used:

The formula bar shows the formula `=G2 & " - " & H2`. This formula uses concatenation to merge the values from columns G and H, separated by a hyphen.

Explanation:

The "Category Type" column was created by combining the Category and Sub-Category fields using a text-joining formula. This helped convert two separate categorical fields into a single structured label for better grouping and analysis.

2. Revenue per Unit

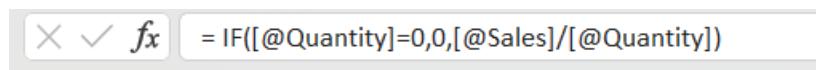

Purpose:

To find how much revenue was generated per individual unit sold.

How it was created:

Revenue per Unit = Total Sales ÷ Quantity

Formula used:

= IF([@Quantity]=0,0,[@Sales]/[@Quantity])

Explanation:

The "Revenue per Unit" column was generated by dividing total sales by the quantity sold using a calculated formula. This helps identify high-value and low-value products based on per-unit revenue.

3. Order Year

Purpose:

To extract the year from the Order Date for grouping data by yearly trends.

How it was created:

Order Year = YEAR (Order Date)

Formula used:

= YEAR([@[Order Date])

Explanation :

The "Order Year" column was created by extracting only the year component from the Order Date using the YEAR () function. This enables year-wise trend analysis in Pivot Tables and Power BI.

4. Order Month

Purpose:

To extract both month name and year for monthly trend visualization.

How it was created:

Order Month = TEXT (Order Date, "MMM-YYYY")

Formula used:

```
X ✓ fx = TEXT([@Order Date],"mmm-yyyy")
```

Explanation:

The "Order Month" column was created using the TEXT () function to convert the full date into a readable Month-Year format such as "Nov-2022". This format is ideal for time-series visualizations.

Pivot Tables:

| Order Month | Sum of Sales |
|--------------------|-----------------------|
| Sep-2023 | ₹ 91,839.52 |
| Sep-2022 | ₹ 88,242.52 |

| | Phones Product | 101305.6454 | ₹ 3,59,366.71 |
| | Grand Total | 715329.2195 | ₹ 24,92,804.15 |
| | | | 1000 |

1. Pivot Table for Monthly Sales Analysis

- A Pivot Table was created using the **Order Month** column to summarize monthly performance.
- The **Sum of Sales** field was added to calculate total revenue for each month.

- The data was sorted chronologically to identify trends across 2022 and 2023.
- Conditional formatting (Color Scale) was applied to highlight **highest** and **lowest** monthly sales.

2. Pivot Table for Category-wise Performance

- A Pivot Table was created using **Category** and **Sub-Category** columns.
- The following fields were included:
 - **Sum of Revenue per Unit**
 - **Sum of Sales**
 - **Count of Order ID**
- This helped compare which category (Furniture, Office Supplies, Technology) contributed the most to revenue and order volume.
- Conditional formatting was applied (Green --> High, Red -->Low) for better comparison.

3. Pivot Table for Customer-wise Profit:

| Total Profit based on Customer | |
|--------------------------------|----------------------|
| Customers | Sum of Profit |
| ⊕ Aarav | ₹ 21,806.50 |
| ⊕ Ananya | ₹ 17,319.40 |
| ⊕ Diya | ₹ 26,959.66 |
| ⊕ Karthik | ₹ 20,599.06 |
| ⊕ Meera | ₹ 17,085.80 |
| ⊕ Rohan | ₹ 15,040.30 |
| ⊕ Sneha | ₹ 21,843.15 |
| Grand Total | ₹ 1,40,653.87 |

- Customer names were used as rows in a Pivot Table.
- Sum of Profit was used as the values field.
- This allowed ranking of customers based on profitability.
- Color formatting highlighted top-earning customers.

5. Pivot Table for Region-wise Profit:

| Total Profit based on Region | |
|------------------------------|----------------------|
| Region | Sum of Profit |
| Central | ₹ 41,861.78 |
| East | ₹ 29,815.91 |
| South | ₹ 23,657.11 |
| West | ₹ 45,319.07 |
| Grand Total | ₹ 1,40,653.87 |

- Region was added as rows to create a region-level profit comparison.
- Sum of Profit was used to identify the most profitable regions (Central, East, West, South).
- Grand Total was used to summarise total profit generated across all regions.

3. Pivot Table for Segment-wise Sales and Profit:

| Sum of Sales and Profit based on the Segments | | |
|---|-----------------------|----------------------|
| Segments | Sum of Sales | Sum of Profit |
| Consumer | ₹ 8,22,020.97 | ₹ 41,757.84 |
| Corporate | ₹ 8,76,768.83 | ₹ 51,096.43 |
| Home Office | ₹ 7,94,014.35 | ₹ 47,799.60 |
| Grand Total | ₹ 24,92,804.15 | ₹ 1,40,653.87 |

- A Pivot Table was built using the Segment column (Consumer, Corporate, Home Office).
- Sum of Sales and Sum of Profit were calculated for each segment.
- This helped identify which customer segment generated maximum profit.
- The Grand Total row summarized overall business performance.

Visualization using POWER BI:

After completing all the data-cleaning steps in Excel, the cleaned workbook was imported into Power BI for further analysis and visualization. I opened Power BI Desktop and selected Home -->Get Data-->Excel, then browsed and chose my cleaned dataset file. After selecting the sheet, I previewed the data to ensure everything was structured correctly and clicked Load to import it into Power BI. Once the data was loaded into the Power BI model, could start creating measures, building visualizations, and designing the dashboard.

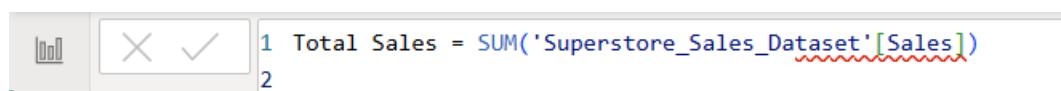

The screenshot shows the Power BI Desktop interface. On the left is a table view of the 'Superstore_Sales_Dataset' table, which contains 100 rows of sales data with columns like Product Name, Sales, Quantity, Profit, and Order Year. On the right is the 'Quick measure' pane, which lists various measures such as Total Sales, Total Profit, and Profit Margin, each with a corresponding DAX formula.

| | Table view | Region | Category | Sub-Category | Product Name | Sales | Quantity | Profit | Category Type | Revenue per Unit | Order Year | Order Month |
|-----------|------------|-----------------|----------|-----------------|--------------|-------|----------|---------|---------------------------|------------------|------------|-------------------|
| Corporate | West | Office Supplies | Binders | Binders Product | 815.65 | 4 | 30.00% | 237.37 | Office Supplies - Binders | 203.91 | 2023 | 01 September 2023 |
| Corporate | West | Office Supplies | Binders | Binders Product | 3721.27 | 6 | 17.00% | 923.63 | Office Supplies - Binders | 620.21 | 2022 | 01 June 2022 |
| Corporate | West | Office Supplies | Binders | Binders Product | 1308.31 | 9 | 1.00% | 26.84 | Office Supplies - Binders | 145.37 | 2022 | 01 December 2022 |
| Corporate | West | Office Supplies | Binders | Binders Product | 2873.59 | 7 | 28.00% | 68.04 | Office Supplies - Binders | 41.08 | 2023 | 01 July 2023 |
| Corporate | West | Office Supplies | Binders | Binders Product | 904.58 | 6 | 15.00% | -104.01 | Office Supplies - Binders | 150.76 | 2023 | 01 March 2023 |

Measures:

Total Sales:

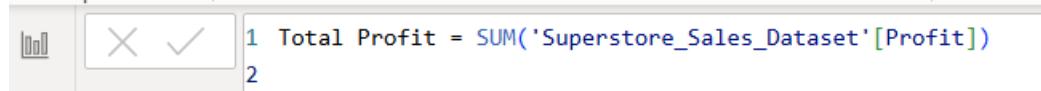

- A DAX measure was created to calculate the *overall sales amount* from the dataset.
- This measure helps understand revenue generated across categories, regions, segments, and customers.
- It was used across multiple visuals like bar charts, category comparison, and segment analysis.
- Formula used:

Total Profit:

- This measure calculates the net profit earned after deducting discounts and cost.

- It helps identify which product categories and regions contribute most to profitability.
- Used in visuals like profit by region, profit by customer, and profit by segment.
- Formula used:

```

1 Total Profit = SUM('Superstore_Sales_Dataset'[Profit])
2

```

Total Orders:

- This measure counts the total number of orders placed in the dataset.
- It helps track order volume across different time periods, categories, and customer segments.
- It was used in KPI cards and pivot-style tables to show order distribution.
- Formula used:

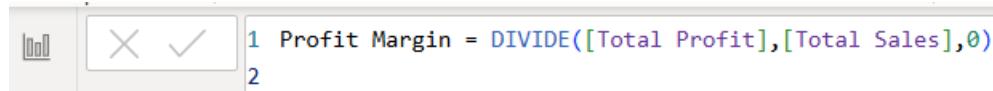

```

1 Total Orders = DISTINCTCOUNT('Superstore_Sales_Dataset'[Order ID])
2

```

Profit Margin (%):

- This measure calculates the percentage of profit earned from total sales.
- It helps evaluate efficiency and whether revenue is translating into good profit.
- Used to compare profitability between segments and product categories.
- Formula used:

```

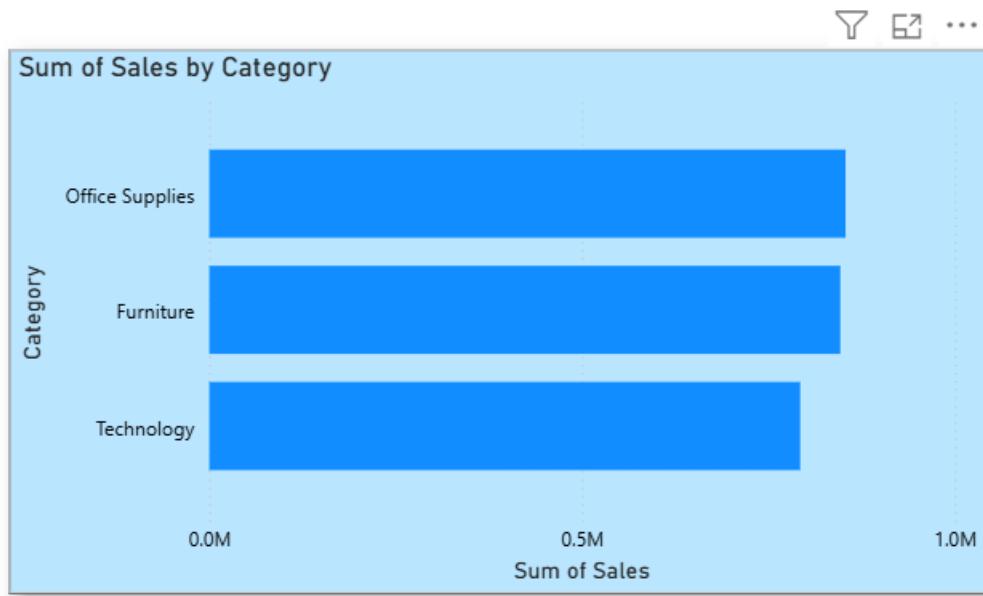

1 Profit Margin = DIVIDE([Total Profit],[Total Sales],0)
2

```

Charts Used:

1. Clustered Bar Chart:

- Used to compare Sales across different Regions / Categories.
- Helps identify which region or category performs the best or worst.
- Easy to analyze trends and differences visually.

2. Line Chart:

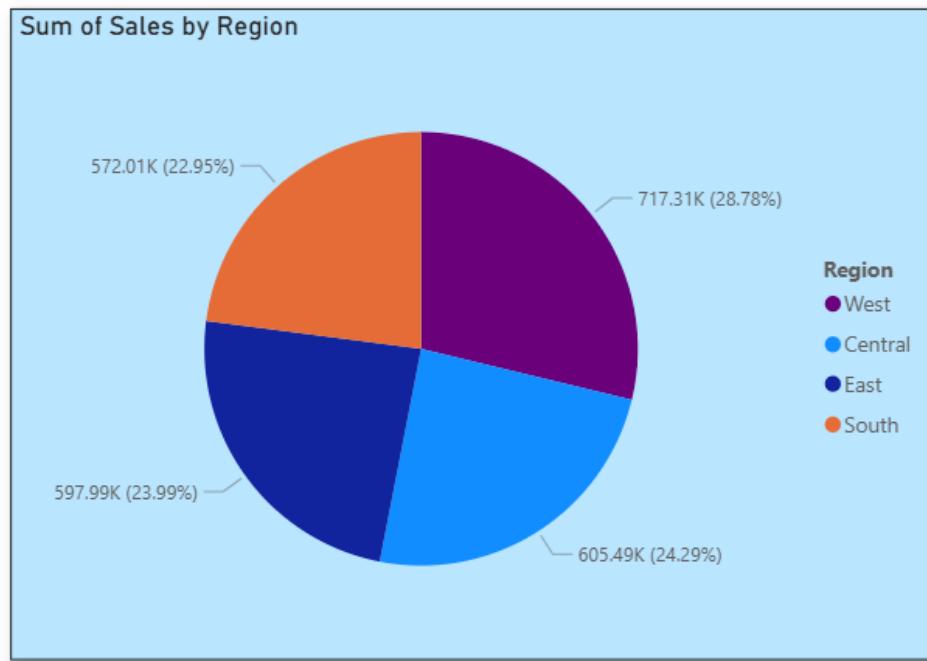

- Used to show Sales trend over months/years.
- Helps understand seasonal patterns, growth or decline in sales over time.

3. Pie Chart:

- Used to show percentage contribution of categories (like Furniture, Office Supplies, Technology).

- Helps visualize how each category contributes to total sales.

Card Visuals:

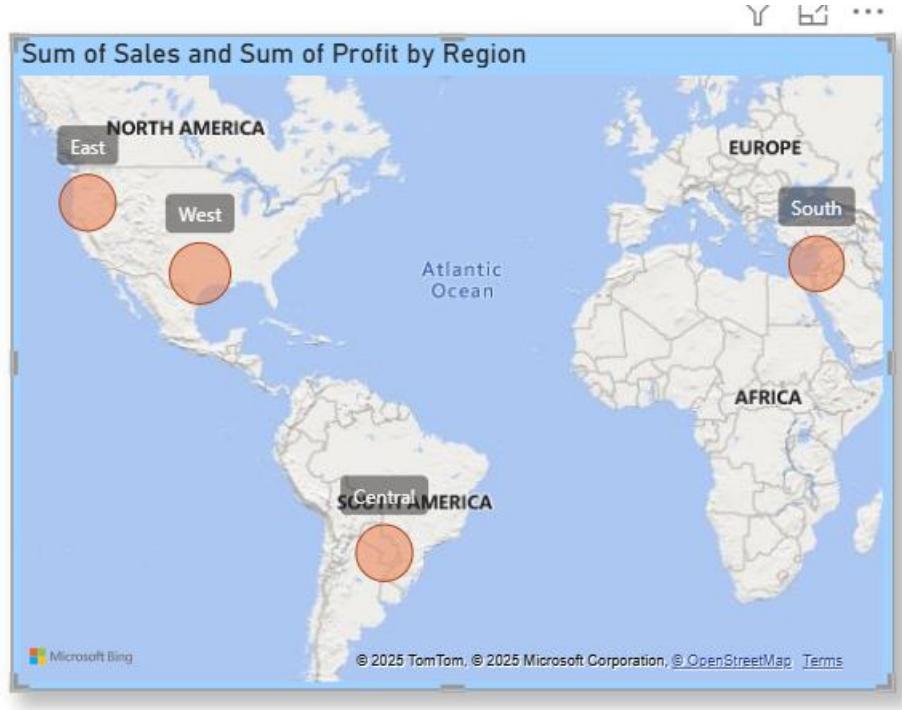

- Used to display key performance indicators (KPIs) like:
 1. Total Sales
 2. Total Profit
 3. Total Orders
 4. Profit Margin
- Provides quick at-a-glance information.

Map Chart:

- A Filled Map (or Map Visual) was used in Power BI to represent Sales and Profit across different regions.

- The Region field was used as the location category, and the Total Sales measure was assigned as the value.
- Color saturation was applied to highlight the performance differences between regions.

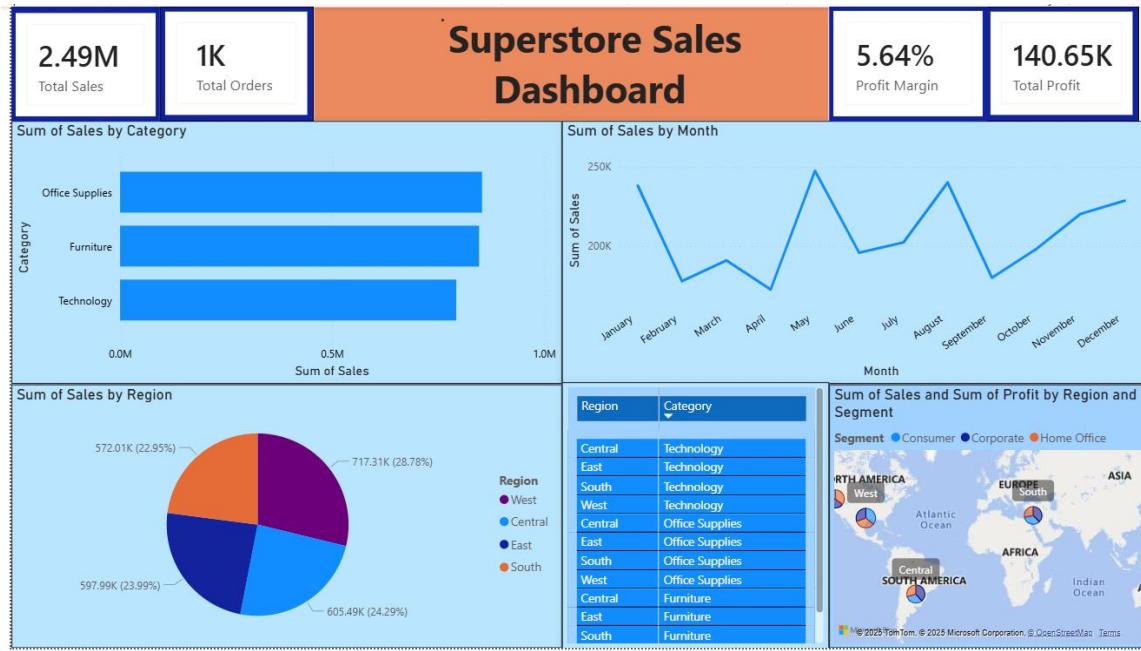

5. Slicer (Filter):

- Used to filter the dashboard by Region, Category, Year, etc.
- Makes the report interactive and easy to explore.

| Region | Category |
|---------|-----------------|
| Central | Technology |
| East | Technology |
| South | Technology |
| West | Technology |
| Central | Office Supplies |
| East | Office Supplies |
| South | Office Supplies |
| West | Office Supplies |
| Central | Furniture |
| East | Furniture |
| South | Furniture |
| West | Furniture |

Final Dashboard:

Slicer used:

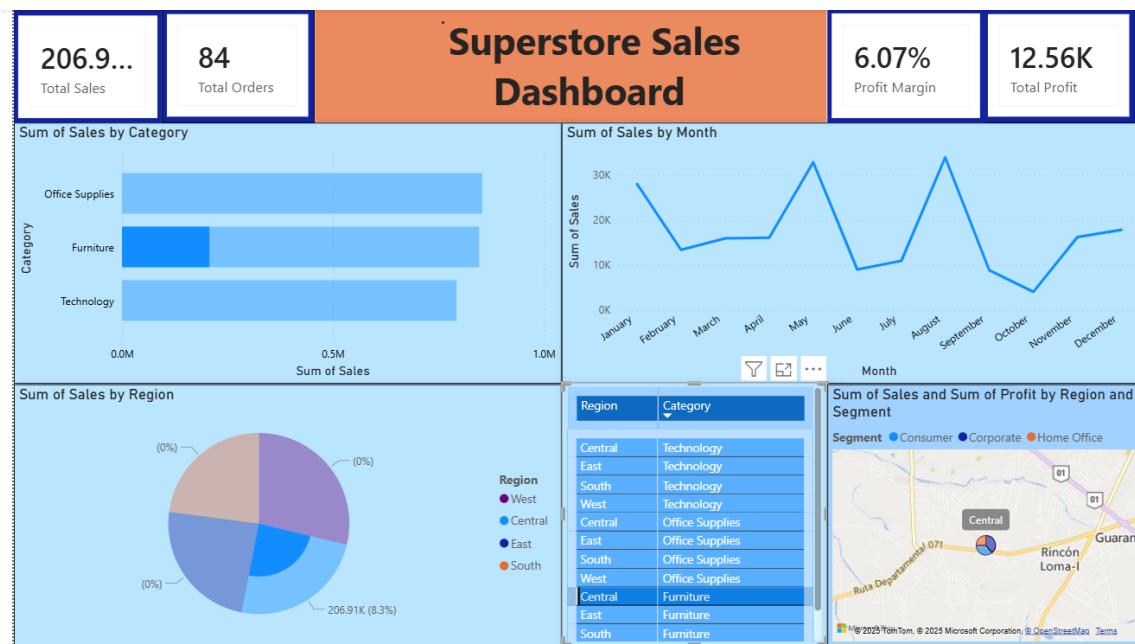

East – Technology

South – Office Supplies

Central - Furniture

Insights:

Overall Sales Performance

The Total Sales KPI shows strong revenue generation, indicating that the business has healthy customer demand across multiple product categories.

- **Profit Distribution**
Profit is not evenly spread across all categories. Some sub-categories show high sales but comparatively low profit, suggesting higher cost or discount impact.
- **Most Profitable Categories**
Technology-related products contribute the highest profit margins, followed by Office Supplies, showing that these areas can be further expanded.
- **Low-Performing Segments**
Certain Furniture items show low or negative profit, indicating possible over-discounting or higher shipping/manufacturing cost.
- **Customer Purchase Trends**
The dashboard shows clear segment-wise differences—Consumer segment contributes most of the orders, while Corporate and Home Office show higher average profit per order.
- **Regional Analysis**
Some regions show higher sales but lower profit, indicating operational inefficiencies or higher returns/discounts.
- **Quantity vs Sales Relationship**
Higher quantity sold does not always result in higher profit, suggesting the importance of pricing strategies.

Summary:

This project focuses on analysing retail superstore sales using Excel for data cleaning and Power BI for visualization. First, the raw dataset was thoroughly cleaned by removing duplicates, correcting inconsistencies, replacing missing values, standardizing formats, and creating calculated fields. After cleaning, the dataset was imported into Power BI for building an interactive dashboard.

In Power BI, four key measures were created—Total Sales, Total Profit, Total Orders, and Profit Margin—to understand the overall business performance. Multiple charts such as bar charts, line charts, donut charts, tables, and slicers were designed to explore trends across categories, regions, segments, and time. The dashboard clearly highlights revenue patterns, profit contribution, customer segments, and category-wise performance.

Overall, the analysis helps identify strong performing areas like Technology products and highlights improvement opportunities such as Furniture category profitability. The project successfully demonstrates the end-to-end analytics process—from data cleaning to dashboard creation—providing clear insights for business decision-making.
